PLUGINS

Summary

- **Task Runners, Version Control, and Plugins**

- Grunt.js tasks can be created and executed directly inside of WebStorm
- Using Gulp.js with WebStorm includes support for debugging via configurations per task
- Testing out new ideas is easy once you understand how the Local History feature works
- You can manage Git as your source code versioning directly inside the IDE
- Even GitHub is integrated so you can create new repositories and link them as Git remotes
- Plugins are the magic of extending WebStorm...if you need something, a plugin might already exist.
